END SEMESTER EXAMINATION 2024-25

Name of the Course: B. Tech. PEName of the Paper: Data Science

Semester VI

Paper Code: TPE 605

Time: 3 Hours

Maximum Marks: 100

Note: -

- (i) All questions are compulsory.
(ii) Answer any two sub questions among a, b & c in each main question
(iii) Total marks in each main question are twenty.
(iv) Each question carries 10 marks

Q1	(20marks)	CO1
(a)	Explain the various types of Analytics i.e. Descriptive, Predictive, and Prescriptive used in Data Science. Describe their purpose, functionality, and practical applications in real-world industries such as healthcare, retail, and finance. Additionally, explain how basic descriptive analysis (including mean, median, mode, and standard deviation) is applied to datasets to summarize numerical data and derive initial insights from raw information.	
(b)	Describe the Analytics Methodology Framework used in Data Science and elaborate on its phases including problem definition, data collection, data preparation, model development, evaluation, and deployment. Also, explain the general process of implementing a data science solution, including steps such as data loading, identifying the problem, data cleaning, and generating summary statistics.	
(c)	Discuss the different types of Data Science Models and Algorithms commonly used in the field, such as regression, classification, clustering, and recommendation systems. Provide examples for each type and compare their purposes. Also, clearly differentiate between supervised and unsupervised learning approaches in terms of input data, output prediction, and real-world applications.	
Q2	(20marks)	
(a)	Define SELECT statements in SQL. How are SELECT statements used to retrieve specific data from a database? Explain with syntax and examples. Write an SQL query to select employee names and salaries from an "Employees" table where the salary is above 50,000.	CO1

Employees Table			
EmployeeID	Name	Department	Salary
1	Rajesh Kumar	HR	48000
2	Priya Singh	IT	52000
3	Anil Mehra	Finance	55000
4	Divya Patel	Marketing	47000
5	Ravi Verma	IT	60000

(b)	What are different types of SQL JOINS? Explain INNER JOIN, LEFT JOIN, RIGHT JOIN, and FULL OUTER JOIN with examples. Write SQL queries using JOINS to extract data from two tables: Orders and Customers, such that you get a list of customer names and their corresponding order amounts.	
-----	---	--

Customers Table		
CustomerID	CustomerName	
101	Aman Gupta	
102	Neha Sharma	
103	Rohan Das	
104	Sneha Roy	

Orders Table			
OrderID	CustomerID	OrderAmount	
1	101	2000	
2	103	3500	
3	101	1500	
4	105	4000	

(c)	Explain the purpose and working of GROUP BY and HAVING clauses in SQL with examples. How do they differ from WHERE? Write an SQL query to group products by category in a "Products" table and find the average price of products in each category, filtering out groups where the average price is less than 100.	
-----	--	--

Products Table			
ProductID	ProductName	Category	Price
1	Pen	Stationery	20
2	Notebook	Stationery	80
3	Calculator	Electronics	500
4	Laptop	Electronics	45000
5	Desk Lamp	Furniture	700
6	Chair	Furniture	1500

Q3	(20marks)	CO2
(a)	Define Descriptive Statistics. Explain mean, median, mode, variance, and standard deviation with examples. Calculate all five measures manually for the following dataset: Sample Dataset: 45, 67, 89, 45, 70, 90, 55, 67, 80, 55
